

Report on Customer Insights Dashboard: Optimizing Retention, Spend and Marketing

Prepared by: Akande Gafar
Junior Data Analyst at Trend Vault

Project Executive Summary

Trend Vault is a fast-growing online fashion and lifestyle e-commerce platform serving 350 customers across six major U.S. cities. This report presents a complete, data driven analysis of customer spending, satisfaction, discount effectiveness, churn risk, and segment performance. The objective is to move Trend Vault's marketing and operations teams from intuition-based to evidence-based decisions, and to build the analytical foundation that will support customer segmentation and churn prediction models.

The analysis reveals a business that is performing exceptionally well in premium markets but facing a concentrated and urgent churn threat elsewhere. Gold members in San Francisco and New York generate over half of all revenue at nearly three times the spend rate of Bronze members. At the same time, 116 customers (33.1% of the entire base) are classified as at-risk, all located in Chicago and Miami, all unsatisfied, and all inactive for an average of 43 days. Trend Vault's blanket discount strategy is making this worse, reducing average spend by 12.9% without improving loyalty. Five targeted, measurable recommendations are presented at the close of this report.

Key Findings

From the Trend Vault data set, I was able to gather some findings of which are listed and analyzed below;

- The Membership Tier that Is the Strongest Revenue Predictor

Gold members spend an average of \$1,311.14 per customer, which is 2.77 times more than Silver members (\$748.43) and 2.77 times more than Bronze members (\$473.39). Gold members make up only 33.4% of the customer base but drive approximately 51% of total revenue. No Gold member in any city is currently at risk of churning, making this segment both the most valuable and the most stable in the dataset.

Gold members are 1 in 3 customers but generate more than half of all revenue. Losing 10 Gold members costs more revenue than losing 30 Bronze members.

- Location is the biggest factor separating the successful markets from struggling ones.

San Francisco leads with an average spend of \$1,459.77 per customer, followed by New York at \$1,165.04. Houston ranks last at \$446.89, a 3.3x difference. More critically, 100% of at-risk customers are in Chicago and Miami only. San Francisco, New York, Los Angeles, and Houston carry zero churn risk. This geographic split is perfect and consistent across all 350 customers, making city the most reliable single indicator of churn risk in the dataset.

- Discounts Are Reducing Spend, Not Increasing It

Customers who received discounts spent an average of \$787.27 versus \$903.49 for non-discounted customers. That is a 12.9% reduction in average spend per discounted customer. Discounted customers also purchased fewer items on an average and this confirming that discounts have no positive relationship with revenue or loyalty. Trend Vault's current discount approach is draining margin without earning any measurable return.

Discounts are not earning loyalty or higher spend. They are being applied broadly to customers who would have spent more without them.

- At-Risk Customers Have a Precise, Identifiable Profile

The 116 at-risk customers are not randomly spread. They share a completely consistent profile, a satisfaction level, and average spend of \$595.14 (vs. \$969.44). Every at-risk customer is either Bronze or Silver tier and located exclusively in Chicago or Miami. Not a single Gold member in any city is at risk. This level of consistency means churn is highly predictable and a future model could be trained on just these three variables with strong accuracy.

- Gender Shows a Significant and Consistent Spend Gap

Male customers average \$986.93 in spend versus \$703.83 for female customers, a gap of \$283.10 per customer (40% higher for males). Males also purchase more items than Female (\$2527 vs \$1883) with exactly 175 customers of each gender, this is a structural pattern, not sampling variation. Closing even half this gap for female customers would add approximately \$24,770 in annual revenue.

Actionable Insights

- Insight 1: Chicago and Miami Are a Concentrated Revenue Emergency

Every single at-risk customer is in Chicago or Miami, everyone is unsatisfied, and everyone has been inactive for over a month on average. This is not a general retention problem. It is a specific, geographic, tier-level failure. Something in Trend Vault's product, pricing, or service experience in these two cities is consistently failing Bronze and Silver customers. This requires immediate, targeted intervention, not a general marketing campaign.

- Insight 2: The Discount Budget Is Actively Destroying Margin

Right now, Trend Vault is giving discounts to 175 customers, but here is the problem; customers who receive those discounts actually end up spending less, not more. On average, a discounted customer spends \$116.22 less than a customer who received no discount at all. That means instead of discounts driving more purchases, they are quietly cutting into revenue every time they are used.

- Insight 3: Female Customers Are Underserved and It Is Costing Trend Vault Money

Female customers make up exactly half of Trend Vault's customer base, but they are spending \$283 less per visit than male customers. That is not a small gap. It is consistent across all 175 female customers in the data. The opportunity here requires no new marketing spend and no new customer acquisition. These customers already exist. If their average spend is lifted to match the overall customer average, Trend Vault gains an additional income in annual revenue from people already in the database. A short targeted survey to understand what falling short for female customers is the fastest first step toward closing that gap.

Recommendations

- Recommendation 1: Launch a Targeted Re-engagement Campaign in Chicago and Miami

Send a personalized email to all 116 at-risk Bronze and Silver members in Chicago and Miami offering a 15% discount valid for 14 days, triggered at 30 or more days of inactivity. Pair it with a short 3-question satisfaction survey. This is the single highest-priority action the business can take right now.

Parameter	Detail
Target audience	All 116 at-risk Bronze and Silver customers in Chicago and Miami
Offer	15% discount valid 14 days, triggered at 30-day inactivity mark
Expected reactivation	25% to 30% of 116 customers (29 to 35 customers)
Revenue recovery estimate	\$17,260 to \$20,830 based on at-risk avg spend of \$595.14
Timeline	Actionable within 2 weeks using existing customer email data

- Recommendation 2: Replace Blanket Discounts with Trigger-Based Discounts Only

Remove discounts from active Gold members and regularly purchasing customers. Redirect the budget to an automated trigger that is any customer with 30 or more days of inactivity and a rating below 4.0 receives a 10 to 15% discount offer automatically. This converts discounts from a margin-destroying habit into a precision retention tool and stops the current \$116.22 per-customer spend suppression.

Parameter	Detail
Current problem	175 customers receive blanket discounts, reducing avg spend by \$116.22 each
New approach	Discount only customers with 30+ day inactivity and rating below 4.0
Budget impact	Estimated 30 to 40% reduction in discount spend, higher strategic impact
Revenue effect	Removing discounts from active Gold members recovers ~\$116 per customer affected

- Recommendation 4: Create a Bronze-to-Silver Upgrade Pathway

Offer Silver membership at 20% off the first-year rate to Bronze members in Chicago who have made at least two purchases. Silver members spend \$275.04 more per year than Bronze members on average. Converting just 20 of the 58 at-risk Bronze customers adds approximately \$5,501 in annual revenue while reducing the at-risk pool and increasing customer switching costs.

Parameter	Detail
Target	Bronze members in Chicago with 2 or more lifetime purchases
Offer	Silver membership at 20% off for the first year
Revenue uplift per conversion	+\$275.04 per year (Silver minus Bronze avg spend)
Revenue impact at 20 conversions	+\$5,501 additional annual revenue
Secondary benefit	Reduces at-risk pool and raises customer loyalty ceiling

- Recommendation 5: Investigate and Close the Female Customer Experience Gap

Commission a focused 10-question survey to female customers across all cities, covering product relevance, pricing perception, and experience drivers. Set a 12-month target to close 50% of the \$283.10 spend gap between male and female customers. Achieving that target adds approximately \$24,770 in incremental annual revenue from existing female customers with zero acquisition cost.
